INTERNATIONAL APPLICATION NO. PCT/GB99/03775	INTERNATIONAL FILING DATE 12 November 1999 (12.11.99)	PRIORITY DATE CLAIMED 13 November 1998 (13.11.98) 7 January 1999 (07.01.99)	
TITLE OF INVENTION BODY FAT MEASUREMENT SYSTEM			
APPLICANT(S) FOR DO/EO/US Amanda HAWTHORNE et al.			
Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:			
1. <input checked="" type="checkbox"/> This is a FIRST submission of items concerning a filing under 35 U.S.C. 371.			
2. <input type="checkbox"/> This is a SECOND or SUBSEQUENT submission of items concerning a filing under 35 U.S.C. 371.			
3. <input type="checkbox"/> This express request to begin national examination procedures (35 U.S.C. 371(f)). The submission must include items (5), (6), (9) and (21) indicated below.			
4. <input type="checkbox"/> The US has been elected by the expiration of 19 months from the priority date (Article 31).			
5. <input checked="" type="checkbox"/> A copy of the International Application as filed (35 U.S.C. 371(c)(2))			
a. <input checked="" type="checkbox"/> is transmitted herewith (required only if not transmitted by the International Bureau).			
b. <input checked="" type="checkbox"/> has been transmitted by the International Bureau.			
c. <input type="checkbox"/> is not required, as the application was filed in the United States Receiving Office (RO/US).			
6. <input type="checkbox"/> A translation of the International Application into English (35 U.S.C. 371(c)(2)).			
7. <input type="checkbox"/> Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3))			
a. <input type="checkbox"/> are transmitted herewith (required only if not transmitted by the International Bureau).			
b. <input type="checkbox"/> have been transmitted by the International Bureau.			
c. <input type="checkbox"/> have not been made; however, the time limit for making such amendments has NOT expired.			
d. <input type="checkbox"/> have not been made and will not be made.			
8. <input type="checkbox"/> A translation of the amendments to the claims under PCT Article 19 into English (35 U.S.C. 371(c)(3)).			
9. <input type="checkbox"/> An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)).			
10. <input type="checkbox"/> A translation of the annexes to the International Preliminary Examination Report under PCT Article 36 into English (35 U.S.C. 371(c)(5)).			
Items 11 to 20 below concern other document(s) or information included:			
11. <input type="checkbox"/> An Information Disclosure Statement under 37 CFR 1.97 and 1.98.			
12. <input type="checkbox"/> An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.			
13. <input type="checkbox"/> A FIRST preliminary amendment.			
14. <input type="checkbox"/> A SECOND or SUBSEQUENT preliminary amendment.			
15. <input type="checkbox"/> A substitute specification.			
16. <input type="checkbox"/> A change of power of attorney and/or address letter.			
17. <input type="checkbox"/> A computer-readable form of the sequence listing in accordance with PCT Rule 13ter.2 and 35 U.S.C. 1.821 - 1.825.			
18. <input type="checkbox"/> A second copy of the published international application under 35 U.S.C. 154(d)(4).			
19. <input type="checkbox"/> A second copy of the English language translation of the international application under 35 U.S.C. 154(d)(4).			
20. <input checked="" type="checkbox"/> Other items or information: International Search Report and International Preliminary Exam. Report

BODY FAT MEASUREMENT SYSTEM

The present invention relates to a system for measurement of the percentage of body fat by weight of four legged mammals, in particular four legged domestic pet mammals such as domestic cats.

Obesity is the most common form of malnutrition in cats, however, the links between obesity and the risk of clinical conditions are not well understood. This is primarily because there is no accepted method for defining obesity or measuring body fat in cats.

The body mass index (BMI), which is based only upon measurements of body weight and height, allows objective measurement available for humans. The main techniques available to veterinary practitioners are subjective ones such as the Body Condition Score (BCS) system produced by Laflamme.

We have appreciated the requirement for a simple, objective system for determining the percentage body fat by weight of four legged domestic pet mammals, in particular cats. In particular, we have appreciated that the system should be reliable and capable of implementation in both technologically simple and complex embodiments. The system should also be easy for inexperienced operators to use.

Accordingly, there is provided a four legged domestic pet mammal body fat determining system for determining the percentage body fat of a four legged domestic pet mammal, comprising:

- means for measuring a first body dimension having a high correlation with percentage body fat;

WO 00/28897

PCT/GB99/03775

- 2 -

- means for measuring a second body dimension having a low correlation with percentage body fat; and
- a look-up table comprising a first storage area for storing entries of the first body dimension, a second storage area for storing entries of the second body dimension and an output area for indicating the percentage body fat determined from a relationship between the first and second body measurements.

The system of the invention has the advantages of being simple to operate, reliable and capable of implementation as a low technological manual system, or a more sophisticated computerised implementation.

In a preferred embodiment the first body dimension is the circumference of the ribcage. This measurement has been appreciated, through experimentation, to be highly correlated to a four legged mammal's percentage body fat. In the embodiment, the second body dimension is a leg index measurement, preferably the distance between the Patella (knee) and the calcaneal tuber (hock) with the leg flexed of the hind limb which, we have appreciated, has a low correlation with percentage body fat. The use of the body measurement of high correlation with body fat and one with low correlation increases the accuracy of the determined percentage body fat.

We have also appreciated the difficulties in providing a correct energy allowance for four legged domestic pet mammals such as cats.

Feeding guides for cats are based on an understanding of their daily energy requirement. A precise understanding of the energy requirement of the cat is therefore fundamental for the development of accurate feeding guides. If the predicted energy requirement of a cat is lower than the actual energy needs then the feeding guide

WO 00/28897

PCT/GB99/03775

- 3 -

will not provide sufficient energy. On the other hand if the estimated energy requirement for a cat overestimates the actual energy needs then the feeding guide will provide too much energy which can potentially cause the animal to become overweight.

We have also appreciated that a system for measuring percentage body fat can be used to provide a system for determining the energy requirement and ideal weight of a four legged mammal, such as a cat.

Accordingly, there is also provided a four legged domestic pet mammal target body weight determining system for determining a target body weight for a four legged mammal, comprising: a system for measuring the percentage body fat of a four legged domestic pet mammal; and a lookup table comprising a first storage area for storing entries of the percentage body fat, a second storage area for storing entries of body weight, and an output storage area storing an indication of the target body weight. The preferred embodiment also comprises a system for determining the energy requirement based on the ideal weight.

A system embodying the invention will now be described with reference to the accompanying figures in which:-

Figure 1 - is a diagrammatic representation of a system embodying the invention;

Figure 2 - is a diagrammatic representation of a first look-up table for use in the system of Figure 1;

Figure 3 - is a diagrammatic representation of a second look-up table for use in the system of Figure 1;

30-01-2001

- 4 -

Figure 4 - is a diagrammatic representation of a third look-up table;

Figure 5 - is a diagrammatic representation of a fourth look-up table;

5 Figure 6 - is a diagrammatic representation of a fifth look-up table; and

Figure 7 - is a diagrammatic representation of a sixth look-up table.

10 The embodiment shown in Figure 1 may be either manually operated, or a computerised system. A first measurement device 10 and a second measurement device 12 are provided to take measurements of, respectively, the ribcage circumference and the leg index measurement [LIM] to provide the results to the look-up table 18. In a
15 computerised embodiment, the measurement devices 10, 12 would provide measurement signals to a computer, storing therein in first, second and output storage areas respectively, ribcage and LIM, and corresponding fat percentage indications. These are shown as storage and
20 determination functions 14 in Figure 1. The results are displayed as an output display 16. The determination algorithm (described later) could be coded in any simple computer language, and is within the common general knowledge of the skilled person, and need not be described
25 here.

A manual representation of the look-up table 18 is shown in Figures 2 and 3. There is shown a first storage area 20, storing first body dimensions (ribcage) measurements, and a second storage area 22, storing second body
30 dimensions (LIM). An output storage area 24 stores an

WO 00/28897

PCT/GB99/03775

- 5 -

indication of the percentage body fat of a domestic cat as a relationship of the first and second dimensions. The indication is under, normal or overweight in Figure 2. In figure 3, the indication is given as a percentage number.

5 In appreciating that the system embodying the invention provides a uniquely robust and reliable system for determining the percentage body fat of a cat, a number of experiments were undertaken, as will now be described.

10 To establish the correlation between body condition score (BCS) and body composition (% body fat) as measured using Dual Energy X-Ray Absorptiometry (DXA), and to compare zoometric measurements with estimates of body condition score and % body fat using DXA, in order to develop a simple objective method of determining body condition, the
15 following method was adopted.

Zoometric measurements and estimates of BCS (body condition score) and body composition (using DXA), were take from 60 domestic, short-haired cats, housed indoors. All measurements were taken between 03/03/97 and 22/05/97,
20 by a single observer. In the study, 28 males (all neutered) and 32 females (of which 8 were entire) were used. The average age of the females was 4.92 years and males 3.94 years. The body weights of entire female cats ranged from 2.34 to 4.1 Kg, the neutered female cats from
25 2.84 to 6.6 Kg and the males 4.2 to 8.18 Kg. Cats had been fed a variety of diets at the time measurements were taken.

The following zoometric measurements were taken from each cat. These were selected because they were considered to
30 represent body condition or had been found from human data to be potentially useful.

WO 00/28897

PCT/GB99/03775

- 6 -

Height: The distance between the ground and the Withers (the top of the shoulder blade or scapula) as measured using a measuring stick. This is a wooden metre ruler with a fixed base, perpendicular to the rule and a sliding wooden bar.

5

Chest Dept: The vertical distance from the top of the capula to the bottom of the chest, using a measuring stick.

10

Girth: The circumference at the point of the 4th lumbar vertebrae, just behind the last rib, using a measuring tape.

Ribcage: The circumference at the point of the 9th rib (5 ribs from the posterior end of the ribcage), using a tape measure.

15

Length: The horizontal distance from the breast-bone (manubrium) to the thigh perineum), using a measuring stick.

20

Elbow: Measured on the left elbow using a calliper. It is the distance between the lateral epicondyle of the humerus and the medial epicondyle of the humerus.

25 Front Long Bone: The length of the humerus, from the proximal ulnar epiphysis to the distal radial epiphysis, using a measuring stick.

30 Leg index measurement [LIM]: The distance between the Patella (knee) and the calcaneal tuber (hock) with the leg flexed.

05834733.040302

WO 00/28897

PCT/GB99/03775

- 7 -

All measurements were taken from the left hand side of the cat whilst it was standing with its legs perpendicular to the ground and with its head up and looking forward. Cats were weighed prior to taking the measurements, which were
5 taken in a fasted state. Five replicates of each measurement were taken on the same day.

The Purina Body Condition Score (Laflamme, 1998) was used as a subjective assessment of body condition. The cat was given a score on a nine point scale, which ranged from 1
10 for emaciated to 9 for morbidly/grossly obese, although experienced assessors are able to grade cats to 0.5 of a scale. A cat with a BCS score of 5 was considered to be ideal. This scoring system was based on a variety of features, which included palpability of the ribs, presence
15 of a discernible waist and abdominal tuck, and evidence of bony prominence and fat deposits on the lumbar area and base of the tail.

The percentage body fat was measured by dual energy X-ray absorptiometry, using a Hologic QDR 1000/W densitometer.
20 They were anaesthetised using Domitor (0.1ml/Kg) and recovery induced with Antisepen.

Eight inexperienced observers each made an estimate of BCS and took their replicates of each zoometric measurement on the same seven cats, in order to test for inter-observer
25 variability in predicting body condition.

Each Zoometric measurement was compared with % body fat because this represented the most objective estimate of body composition. The most significant correlation with % body fat was for ribcage. This factor is more likely to
30 be affected by an increase in body weight or obesity. It may therefore be considered to provide an estimate of % body fat, or 'fatness'. The lowest correlation's with % body fat were found for the LIM and height measurements

2000040 "EE/TEB50

WO 00/23897

PCT/GB99/03775

- 8 -

($r^2 < 15.4\%$). This is a low correlation. These may therefore be considered to be measurements of stature which are relatively unaffected by changes in % body fat.

We appreciated that a system could be devised using this data to provide a simple system for measuring the percentage body fat of cats. The formula that describes the most variation in percentage body fat and is biologically meaningful is:

$$Fat = \left[\frac{\left(\frac{Ribcage}{0.7067} - LIM \right)}{0.9156} \right] - LIM$$

The mean, standard deviation and coefficient of variation were determined for each of the 60 cats from the five replicates made for each zoometric measurement by the experienced observer. The mean and median coefficient of variation (CV) for each zoometric measurement was less than 10% suggesting that the intra-observer repeatability was low and that a single measurement would be needed in future (see table below).

CV for each zoometric measurement made by a single experienced assessor.

	Coefficient of Variation (%)			
	Mean	Median	Min	Max
Weight	2.30	1.19	0	12.78
Girth	1.96	1.57	0.27	6.74
Ribcage	3.03	2.6	0.5	15.57
Height	1.49	0.93	0.18	8.94
Chest Dept	3.54	3.34	1.36	9.62
Length	2.37	2.15	0.22	6.26
Elbow	4.28	4.35	0	9.56
Front Long Bone	2.11	1.77	0	5.26
LIM	2.5	2.16	0.33	8.19

WO 00/28897

PCT/GB99/03775

- 9 -

The cats included in this study encompassed a wide range of body composition and age, but were of a single population of related genetic domestic short-haired stock. They may therefore form a representative sub-sample of the domestic cat population in general.

BCS was significantly correlated with % body fat, when measured using DXA ($r^2 = .734\%$, $p < 0.01$) and gave a reasonable prediction of % fat. However, the correlation was lower than that reported by Laflamme (1998) where $r^2 = 83.5\%$, although 48 cats were used in this study, of which only 4 individuals had a BCS less than 5. Using the BCS system in this study, cats which were of ideal body condition (BCS = 5) had between 15 and 30% body fat. Cats which were considered to be underweight (BCS < 5), were less than 20% fat and those which were overweight (BCS > 6) were more than 30% fat. Whilst these data sets are relatively small (underweight group = 7 cats, ideal = 8 cats) it gives an indication of the cut off points that might be used for these major categories of % body fat for cats. The largest discrepancy between % body fat and BCS occurred for those animals considered to have a BCS between 5 and 6. This may indicate the problems of correctly identifying animals of 'ideal' condition when animals differed greatly in stature. Animal stature, particularly of very large or small cats was considered to be a determining factor in the large variation of BCS assigned to individual cats by different observers, resulting in a relatively high CV of 15.3%. It would appear that the BCS type of assessment is truly subjective.

By comparison zoometric measurements, and ribcage in particular ($r^2 = 82.9\%$) were more highly correlated with % body fat than the BCS system. This is a high correlation.

WO 00/28897

PCT/GB99/03775

- 10 -

The high level of repeatability for the ribcage and LIM measurements of cats and the high correlation between the zoometric model and % body fat suggests that this objective measurement is a more appropriate tool for determining body composition of cats than BCS. In addition it is also non-invasive, requires little training to achieve an acceptable level of repeatability and requires only a metric tape measure. This makes this method available for all veterinary practitioners and cat owners.

Feeding guides for cats are currently formulated on the basis that daily energy requirements are a function of body weight i.e. energy requirement (kcal/day)=70xBW (kg). Different levels of activity (for a given body weight) can be accounted for by using a sliding scale i.e. energy requirement of inactive cats (kcal/d)=50xBW(kg), whilst energy requirement of active cats (kcal/d)=70xBW(kg).

Whilst the effect of different activity levels on energy requirement (and consequently feeding guides) can be accounted for (as above), other factors that influence energy requirements cannot be so easily accounted for using existing methods. In particular body composition or the proportion of fat and fat free mass (or lean tissue) are important factors influencing an individuals energy requirement. Fat free tissue (or lean tissue) is metabolically active whilst fat tissue is not. Energy requirements are therefore determined by the mass of metabolically active tissue (represented by fat free or lean tissue mass) and not by the amount of fat tissue.

Current methods for estimating energy requirements assume that the energy requirement is fixed at a given body weight. However this approach can overestimate energy requirements in certain individuals. For example, in overweight cats lean tissue (or fat free tissue) accounts

WO 00/28897

PCT/GB99/03775

- 11 -

for a lower proportion of body weight than in cats of normal body weight. Consequently the energy requirement per unit body weight of overweight cats will be less than that of normal weight cats. As lean tissue is metabolically active and fat tissue is not, cats which are overweight are likely to be offered excessive energy if fed at an energy requirement which is fixed at a given body weight.

This risk of over feeding obese cats was highlighted in a recent study which showed that the mean daily energy requirement of eight obese adult cats ($47.74 \pm 2.41\%$ fat) was significantly ($P < 0.05$) lower than a group of non-obese ($26.05 \pm 1.61\%$ fat) age and sex matched cats, when compared on a kg body weight basis (33 ± 2 kcal/kg BW and 43 ± 2 kcal/kg BW respectively). However, when this energy requirement is expressed on a lean mass basis (the proportion of body composition which is considered to be metabolically active) there is no difference between the two groups (67 ± 2 and 60 ± 2 kcal/kg lean mass respectively, $P > 0.05$).

Feeding the obese cats at a fixed energy requirement for a given body weight would therefore result in an excessive energy allowance and could result in increasing fatness.

Fat free mass (FFM) consists predominantly of lean mass (approx. 97%) and a small amount of bone mineral content. Therefore, expressing energy requirement on a FFM basis will give more accurate feeding guides because it removes the influence of fat mass. Fat free mass can be determined from the weight of the cat and the percentage body fat content of the animal which can be obtained from the feline body mass index (FBMI) (equation 1).

WO 00/28897

PCT/GB99/03775

- 12 -

Equation 1 $FFM = \text{Body weight(kg)} \times ([100 - \% \text{ Body fat}] / 100)$

The % Body fat could be determined from the Feline Body Mass Index discussed above, or by another method.

5 The FFM can be converted to an "ideal" body weight (equation 2) which determines the mass of the cat with an optimal body composition (Table 1). Data collected at WCPN showed that cats with an optimal body condition had a body fat content of approximately 25%.

Equation 2 "Ideal" weight = $FFM \times 1.33$

10 The "ideal" weight is the weight at which a cat is neither under or over weight, and can be used as a target weight.

There was no significant difference between the obese and non-obese cats in their energy requirement per kg "ideal" weight (48 ± 2 and 44 ± 2 kcal/kg "ideal" weight
15 respectively), demonstrating that feeding guides based upon "ideal" weight could be more useful than the current ones based upon body weight alone, because they take into account body composition (Table 2, 3). In addition, "ideal" weight could also be used to determine target
20 weight and energy requirements for cats under-going weight loss (Table 4).

The optimal body condition of 25% fat was determined by repeated imperial measurements and observation. The energy requirements per kg "ideal" weight were also
25 determined by observation.

CLAIMS

1. A four legged domestic pet mammal body fat determining system for determining the percentage body fat of a four legged domestic pet mammal, comprising:
- means for measuring a first body dimension having a high correlation with percentage body fat;
 - means for measuring a second body dimension having a low correlation with percentage body fat; and
 - a look-up table comprising a first storage area for storing therein entries of the first body dimension, a second storage area storing therein entries of the second body dimension and an output storage area storing an indication of the percentage body fat determined from a relationship between the first and second body measurements.
2. A system according to Claim 1, wherein the first body measurement is the circumference of the ribcage, taken at the 9th rib.
3. A system according to Claim 1 or Claim 2, wherein the second body measurement is a leg index measurement, which is the length of the hind limb measured between the patella (knee) and the calcaneal tuber (hock).
4. A system according to any preceding claim, wherein the output storage area provides an indication of whether the mammal is under, normal or overweight.

WO 00/28897

PCT/GB99/03775

- 14 -

5. A system according to any preceding claim, wherein the output storage area provides a numerical percentage body fat.
6. A system according to any preceding claim, wherein the relationship between the percentage body fat and first and second body dimensions is given by the equation:-

$$\text{PercentageBodyFat} = \left[\frac{\left(\frac{R}{C_1} - L \right)}{C_2} \right] - L$$

where R = ribcage circumference
 L = leg index measurement
 C1 = constant
 C2 = constant

7. A system according to any preceding claim wherein the four legged mammal is a cat.
8. A lookup table for use in the system of any proceeding claim, comprising:
- a first storage area storing therein entries of the first body dimension;
 - a second storage area storing therein entries of the second body dimension; and
 - an output storage area storing an indication of percentage body fat determined from a relationship between the first and second body measurements.

WO 00/28897

PCT/GB99/03775

- 15 -

9. A four legged domestic pet mammal target body weight determining system for determining a target body weight for a four legged mammal, comprising:

a system for measuring the percentage body fat of a four legged domestic pet mammal; and

a lookup table comprising a first storage area for storing entries of the percentage body fat, a second storage area for storing entries of body weight, and an output storage area storing an indication of the target body weight.

10. A system according to claim 9, wherein the relationship between the target weight and the percentage body fat is given by the equation:-

$$\text{Target weight} = 1.33 \times \text{Body weight (kg)} \times ((100 - \% \text{ body fat}) / 100)$$

11. A system according to claim 9 or 10, wherein the target weight is an ideal weight.
12. A system according to claim 9, 10 or 11, wherein the system for measuring the percentage body fat is a system according to any of claims 1 to 7.
13. A system according to any of claims 9 to 12, further comprising an additional output storage area storing an indication of an energy allowance.
14. A system according to claim 13, wherein the indication of energy allowance is a daily allowance in kcal/kg.
15. A system according to any of claims 9 to 14, wherein the four legged mammal is a cat.

COMBINED DECLARATION AND POWER OF ATTORNEY FOR PATENT COOPERATION TREATY APPLICATION

As below named inventors, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled BODY FAT MEASUREMENT SYSTEM

the specification of which was filed as PCT International Application No. PCT/GB99/03775 on November 12, 1999 and was amended under PCT Article 19 on _____ (if applicable).

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR §1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, § 119 of any foreign application(s) for patent or inventor's certificate or of any PCT international application(s) designating at least one country other than the United States of America listed below and have also identified below any foreign application(s) for patent or inventor's certificate or any PCT international application(s) designating at least one country other than the United States of America filed by me on the same subject matter having a filing date before that of the application(s) on which priority is claimed:

Country	Application No.	Filed (Day/Mo./Yr.)	Priority Claimed (Yes/No)
G.B.	9900296.6	7 January 1999	YES
G.B.	9824976.6	13 November 1998	YES

I hereby appoint the practitioners associated with the firm and Customer Number provided below to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith, and direct that all correspondence be addressed to the address associated with that Customer Number:

FITZPATRICK, CELLA, HARPER & SCINTO
Customer Number: 05514

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
